

Dr. Thomas E. Young Launches Revolutionary Fat Transfer Breast Enhancement Procedure

Thomas E. Young, MD, owner of Young Medical Spa announced today that Young Medical Spa in Center Valley, PA has launched the latest technique in fat transfer to perform Natural Breast Augmentation using the patient's own healthy body fat extracted from unwanted areas such as lower abdomen, thighs and buttocks. This procedure is performed under local anesthesia with minimal downtime.

Center Valley, PA ([PRWEB](#)) December 2, 2009 -- [Thomas E. Young, MD](#), Medical Director at Young Medical Spa launched the latest technique in [Breast Augmentation](#) which utilizes fat that is extracted during a Body-Jet® Water-Assisted Liposuction procedure and is then transferred to the breasts where it can typically increase the area by 1 to 2 cup sizes. One of the benefits to this procedure is the removal of unwanted fat in body areas that most women seek to reduce such as, abdomen, hips, thighs and buttocks.

“This procedure is a safe and effective way to remove fat where it's not wanted and contour the body where it is most needed, safely and permanently without the need for invasive surgery.” states Dr. Young, Medical Director of Young Medical Spa the first facility to offer this procedure in the Lehigh Valley and surrounding areas.

Dr. Young has learned this technique by studying with several physicians including Dr. Todd K. Malan of Innovative Cosmetic Surgery Center in Scottsdale, AZ, a recent pioneer in the further development of this new procedure. One of the greatest gains with the new procedure has been in the fat survival rate which is between 85% to 90%. With the addition of adult stem cells to enhance the fat transfer and breast splinting technology, adipocyte survival rates have shown to be even higher. In fact, Dr. Malan states that when the fat transfer is concentrated with adult stem cells harvested from the patient's own fat, and is injected into the fat that is already within the breast, the result can equal a permanent increase of 250cc to 500cc in overall breast size equating to a 1 to 2 cup size increase.

Dr. Young will use the Body-Jet® Water-Assisted Liposuction device which utilizes pulses of water to gently harvest fat from the donor areas, usually the abdomen. The fat is kept in a sterile environment and is transferred to syringes which are then injected into the breast. Unlike laser lipolysis, the Body-Jet® keeps the fat cells alive so they can take their new place within the breast tissue. While there is a minor depletion in volume after the procedure due to any fat cells which may have been destroyed during harvesting, the fat injections result in a permanent 150 cc to 250cc overall breast size increase which would allow for a 1 or 2 bra cup size increase. A pressure splint is sometimes used after the procedure to ensure the fat remains in place as it settles.

For a complimentary consultation or more information on Breast Augmentation at Young Medical Spa call 610-798-SKIN (7546) or email [info\(at\)youngmedicalspsa.com](mailto:info(at)youngmedicalspsa.com).
